

Metatron 12

The Proven Technology Leader
in Milk Monitoring Systems

Metatron 12

Milk monitoring systems

- **Proven performance**

For more than 10 years Metatron systems have been the industry leaders in parlors around the world.

- **Complete control**

Metatron measures milk quantity, milking time and interfaces with DairyPlan C21 software on your personal computer to help you manage your operation better and is a complete pulsation controller.

- **Instant data access**

After cow identification, the cow-side Metatron control automatically signals signs of heat, do not milk warnings and if any special action is required. The positive warning and start delay assures that the operator takes corrective action when milk must be isolated. After cluster removal, Metatron notifies the operator if the cow is off milk or has abnormal conductivity.

- **Accurate records for each cow**

Metatron measures total milk yield, maximum and average milk flow and milking time for each individual cow. When used with WestfaliaSurge DairyPlan C21 software, it also calculates production, mature equivalents, feeding data, days in lactation, days pregnant and other animal health information.

- **Automatic cluster removal**

Automatically removes the cluster when milk flow drops below desired milk-out level.

- **Optional kick-off detector**

Alerts operator immediately, vacuum is shut off to the milker unit and take-off is activated.

- **Versatile meter installation options**

Can be directly mounted on the milk line or remotely mounted to any desired location.

- **Durable, low maintenance design**

Made of durable US Public Health approved tempered polysulfone. Solenoid/diaphragm engineered for accurate performance, long life and low maintenance. No electronics under the curb. Many of the early Metatron systems are still in operation after more than 10 years of continuous use.

- **Optional sampling device**

DHIA approved milk sampling device for component testing is easily attached to the Metatron.

Precise milk meter

Accurately measures milk production in parlors or flat barns.

DHIA approved

Recognized as the industry's most advanced milk monitoring system. Autopuls and Stimopuls pulsation units provide customized pulsation for optimum milking performance.

- Kick-off detectors — for prompt shut-off and operator notification
- Heat track activity monitor aids in heat detection
- Autodip automatic spray pre and post dip saves labor
- DairyPlan C21 software provides reports for total herd management

Parlor planning — WestfaliaSurge will design a floor plan that fits your needs exactly. Give us your specs and we'll prepare the blueprint.
