

GEA Farm Technologies

## The Milking Team

The Allrounder and the Assistant  
for the milking parlour

GEA Farm Technologies – The right choice.

# The new generation of Milking Control Units

**DeMax**

The Assistants ...

... for economic cluster removal.

# Optimise Your Team with DeMax or DemaTron

## Milking, control, and measurement in a new dimension

### DemaTron

#### The Allrounders ...

... for accurate  
measurement and  
specific help.

#### The future at a fair price:

DeMax and DemaTron are the latest members of GEA Farm Technologies' milking control unit family. Important functions ease the work-load in the milking parlour and are with you for the whole of the milking time. Subject to unit type – from easy cluster removal through to ICAR-approved milk metering with cluster removal – this product family gives you a best value entry into leading milking control technology.

#### Once again the right time for milking

With the latest generation of milking control units, you'll profit, just like your milkers, from a pleasant reduction in workload from the start to the end of milking: gain valuable time with the assurance that DeMax and DemaTron are taking care of the essential milking phases for you!

#### Configurable to meet your farm's needs

In complete accordance with the ProFormance philosophy, the DemaTron/ DeMax family can be expanded in a seamless modular manner and installed in existing or newly planned systems. With little effort the DeMax control unit can be upgraded to a DemaTron. From the reliable assistant taking care of gentle and stress-free milking right up to the allrounder with the milk metering to support the herd management, GEA Farm Technologies is able to offer you milking control technology matched to your needs, which will optimise your farm's productivity.

## Intelligent assistants for maximum removal support

The DeMax 55 milking control unit offers you an intelligent entry point into the modern automated milking process and a perfect solution, if cluster removal is of primary importance. Individual pulsator control is a further base function of all GEA Farm Technologies milking control systems. In particular, the use of **StimoPuls** ensures that the milking process begins in the best way for your cow: with the best equipment, in an effective and gentle manner!

Milk flow level  
(yellow)  
Pulsation display  
(green)

# DeMax 55

With its automatic shut off DeMax 55 can control the pulsator.

The first possible upgrade is incorporating automatic cluster removal. In addition the DeMax 55 can also take on an optional extra, such as the KickOff switch. The DeMax control unit with its electronic intelligence, controls the milking process from start to finish, while incorporating a number of important milking control functions. **The result: Optimised milking.**

## Optimum stripping quality with VisoFlow

VisoFlow measures the milk yield flow through the free milk flow and supplies the information required for milking control to the control unit. Thus, the control unit determines the ideal time point for shutting off the vacuum or cluster removal. This means optimal milking every time with a vacuum which is gentle on the udder.

## Start-from-anywhere capability provides new ergonomics

With the various remote start versions provided by GEA Farm Technologies, you can start the milking process from ergonomically advantageous positions. The button in the pulsing hose or press-button on the pit-edge can be quickly and easily reached. **EasyStart** starts the milking process in a particularly easy way: simply raise the cluster.

## DeMax 60 – represents maximum removal comfort

Whether BackFlush, PosiCare or KickOffswitch - dependent on your individual wishes the DeMax 60 can be expanded using various components. The start of milking is particularly gentle if your cow is milked with **StimoPuls**.

# Milk metering made easy

## More than just cluster removal

The Dematron 60 has an unbeatable price/performance ratio. The combination of workload reducing cluster removal and milk yield display is very attractive. Entry into the future of milking technology has never been so easy, than with the "Allrounder".

Milk yield, messages

manual "Start"

Stimulation change / time

# DemaTron 60

*Simple bracket design*

*Top-class, ergonomically designed stainless steel bracket*

*MultiLine with full component integration*

Familiarise yourself with DemaTron 60 and trust the “Allrounder” to determine the optimum removal point. Not only that, timely removal protects the udder and, with it, cow health at every milking. Knowledge of the milk yields allows you to draw valuable conclusions about the state of the animals: How healthy is the animal and what is its current performance level? Can feeding be optimised? With DemaTron 60 you optimise the factors governing success directly in the milking parlour.

Milk yields measured in free flow. Optimised milk metering using the **LactoFlow** milk sensor, that was specially developed for the DemaTron 60, supplies milk yields for daily management in the milking parlour.

Simple, economic starting: Remote starting function possible using a press-button and without the need for an operating terminal

# Top Performance

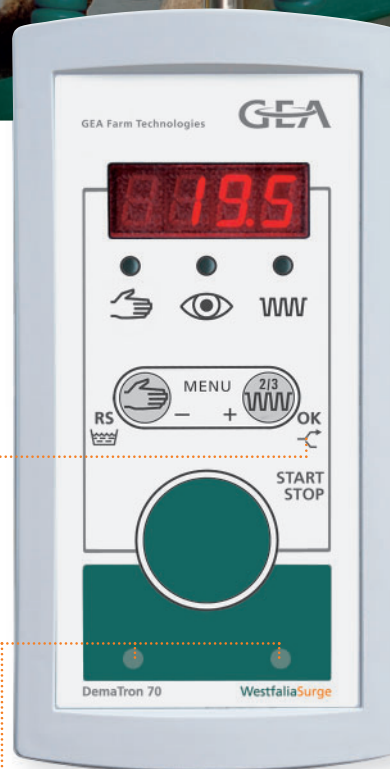

## Herd Management at minimum Cost

DemaTron 70 provides a new relationship between performance and costs. The versatile milk parlour control unit reveals its talent in daily herd management and together with the Metatron MB metering box: precise milk metering is one of its main features. DemaTron 70 is the basis for your future: **The whole wide world of precision livestock farming is now open to you.**

Setting segregation button

LED warning lights for example, flashing at the upcoming end of milking

# DemaTron 70

## DemaTron 75

Integrated in DMS 21 herd management, the unit indicates differences in the current milk yield and conductivity and gives visual indicators such as "No milking". You can set sorting markers directly via the terminal so that you segregate your cows in a targeted and automatic manner.

**Result: less stress at work, enormous time savings.**

### DemaTron 75 for manual animal identification in the milking parlour.

Animals can be quickly and easily allocated a milking stall by entering the respective animal number. This is of particular interest to farmers who do without automatic animal identification. PC based herd management is therefore enabled for a minimum investment.

### Ready for control tasks

The ground-breaking DemaTron 70 is compatible with all GEA Farm Technologies milking parlours and even ready to take over control tasks in other manufacturer's systems. When integrated in the DMS21 herd management system, the DemaTron 70 is an important component in precision livestock farming and as a precise data supplier, the allround manager for individual animal based herd management.

### ICAR recognised for milk control

The DemaTron control calculates the milk flow rate and exact milk yields of your cows using the **Metatron MB** milk meter. A recognised milk sampling function is provided as a matter of course. The accuracy and precise measurement is approved by the international organisation ICAR.

# Precision Livestock Farming

## With the DMS 21, you're fully prepared for the future

To be best equipped for the future, the operator needs individual data on each cow. Milk yields and cow activity data – collected automatically – are an essential aid in health and reproduction management.

GEA Farm Technologies' DairyManagementSystem 21 will help you to keep ahead in herd management both now and in the future.

### Your Dematron is even more powerful with a connection into the DMS 21

#### in the milking parlour:

- ✓ Cow number (responder number) display
- ✓ Display of deviations in milk yield and conductivity
- ✓ Display and if necessary blocking function for "No milking", "Disconnection", "No stripping aid", "No KickOff", and "Drying off"
- ✓ Setting of sorting codes for all AutoSelect versions
- ✓ Feeding in the milking parlour

#### in the office:

- ✓ Analysis of individual milk yields, min./max milk flow using DairyPlan C21
- ✓ Milking parlour management/system information (also for DeMax)
